

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) A detector for detecting the presence of a memory tag, the detector comprising a radio frequency source operable to generate a radio frequency signal and a detector resonant circuit part connected to the radio frequency source, the detector resonant circuit part comprising an antenna,

the detector further comprising a power monitor responsive to the power of a reflected signal returned from the detector resonant circuit part,

the power monitor being operable to generate an output in response to the power of the reflected signal, and

a position processor operable to receive position information indicating the position of the detector and the output from the power monitor.

2. (Original) A detector according to claim 1 wherein the power monitor is operable to generate an output when the power level falls below a threshold.

3. (Original) A detector according to claim 1 wherein the power monitor is operable to generate an output indicating the power of the reflected signal.

4. (Previously Presented) A detector according to claim 1, wherein the position processor is operable to store position information relating to at least one position and the power monitor output at that position, and generate a recommended position output depending on the stored position information and power monitor output information.

5. (Previously Presented) A detector for detecting a memory tag, the detector comprising a radio frequency source operable to generate a radio frequency signal, a detector resonant circuit part connected to the radio frequency source,

a power monitor responsive to the power of a reflected signal returned from the detector resonant circuit part, the power monitor being operable to generate an output in response to the power of the reflected signal, and

a position processor operable to receive position information indicating the position of the detector and the output from the power monitor, wherein

the position processor is operable to store position information relating to at least one position and the power monitor output at that position, and generate a recommended position output depending on the stored position information and power monitor output information.

6. (Previously Presented) A read/write device for reading and/or writing data to a tag, the read/write device comprising a detector, the detector comprising a radio frequency source operable to generate a radio frequency signal and a detector resonant circuit part connected to the radio frequency source, the detector resonant circuit part comprising an antenna,

the detector further comprising a power monitor responsive to the power of a reflected signal returned from the detector resonant circuit part,

the power monitor being operable to generate an output in response to the power of the reflected signal,

a position processor operable to receive position information indicating the position of the detector and the output from the power monitor, and

wherein the read/write device is operable to read data from and/or write data to the tag in response to the power monitor output.

7. (Previously Presented) A read/write system comprising a detector and a movable head provided with an antenna, the detector comprising a detector for detecting a memory tag, the detector comprising:

a radio frequency source operable to generate a radio frequency signal, a detector resonant circuit part connected to the radio frequency source,

a power monitor responsive to the power of a reflected signal returned from the detector resonant circuit part, the power monitor being operable to generate an output in response to the power of the reflected signal, and

a position processor operable to receive position information indicating the position of the detector and the output from the power monitor, wherein the position processor is

operable to store position information relating to at least one position and the power monitor output at that position, and generate a recommended position output depending on the stored position information and power monitor output information,

the read/write system being operable to move the movable head and generate position information corresponding to the position of the movable head,

the read/write system further being operable to transmit the position information to the detector, receive a recommended position output from the detector and move the movable head to a position indicated by the recommended position output.

8. (Original) A read/write system according to claim 7 wherein the read/write system is operable to read data from and/or write data to the tag when the movable head is at the position indicated by the recommended position information.

9. (Original) A read/write system according to claim 8 wherein the read/write system comprises a printer, wherein the movable head comprises a print head and wherein the printer is operable to print on a base medium provided with at least one tag.

10. (Original) A read/write system according to claim 7 comprising a plurality of detectors.

11-12. (Cancelled)

13. (Currently Amended) A printer operable to print on a base medium provided with at least one memory tag, the printer comprising a detector for detecting the presence of a memory tag, the detector comprising a radio frequency source operable to generate a radio frequency signal and a detector resonant circuit part connected to the radio frequency source, the detector resonant circuit part comprising an antenna,

the detector further comprising a power monitor responsive to the power of a reflected signal returned from the detector resonant circuit part,

the power monitor being operable to generate an output in response to the power of the reflected signal,

wherein a decrease in the power of the reflected signal indicates the presence of a tag in the vicinity of the antenna; and

~~A printer according to claim 11~~ having a movable print head, the print head being provided with the antenna, the printer being operable to move the movable head and generate position information corresponding to the position of the movable head, the printer further being operable to transmit the position information to the detector, receive a recommended position output from the detector and move the movable head to a position indicated by the recommended position output.

14. (Original) A printer operable to print on a base medium provided with at least one tag, the printer comprising a detector for detecting the presence of a memory tag,

the detector comprising a radio frequency source operable to generate a radio frequency signal and a detector resonant circuit part connected to the radio frequency source, the detector resonant circuit part comprising an antenna,

the detector further comprising a power monitor responsive to the power of a reflected signal returned from the detector resonant circuit part and operable to generate an output in accordance with the power of the reflected signal,

the printer further comprising a moveable print head, the print head being provided with the antenna, the printer being operable to move the moveable head and generate position information corresponding to the position of the moveable head,

the detector further comprising a position processor, the position processor being operable to receive the position information and the output from the power monitor, store position information relating to at least one position and the power monitor output at that position, and to generate a recommended position output,

the printer being operable to move the moveable head to a position indicated by the recommended position output.

15. (Cancelled)

16. (Previously Presented) A method for detecting the presence of a tag, comprising:

transmitting a signal to a resonant circuit part comprising an antenna;

monitoring the power of a reflected signal reflected from the resonant circuit part; and

moving a detector provided with the antenna relative to the tag, storing position information relating to the position of the detector and power information related to the power

reflected signal at that position, and generating a recommended position in accordance with the stored information.
